

# DATA ANALYTICS, DASHBOARD & REPORTING

## PROFESSIONAL SERVICE DELIVERY GUIDELINE

*From raw data to clear decisions*

| Document Control | Details                                                    |
|------------------|------------------------------------------------------------|
| Prepared by      | Chala Tesfaye                                              |
| Position         | MEAL Coordinator                                           |
| Version          | 1.0                                                        |
| Date             | January 2026                                               |
| Document type    | Professional working guideline                             |
| Service focus    | Data analytics, dashboards, reporting and decision support |

### SERVICE PROMISE

Turn raw organizational data into reliable analysis, decision-ready dashboards, repeatable reporting processes and maintainable management information.

## 1. Purpose

This service helps organizations turn raw data into clear, reliable, and decision-ready information. It brings together careful data preparation, practical analysis, and accessible reporting so that teams can understand performance and act with confidence.

The work covers the full journey: understanding the client's needs, assessing and preparing the data, developing meaningful indicators, building dashboards and reports, checking quality, and handing over a solution that people can use and maintain.

### Primary outcome

A complete, accurate, practical, repeatable and maintainable analytics and reporting solution—not simply a spreadsheet or visualization.

## 2. Service Objectives

| Objective                                                 | Service outcome                               |
|-----------------------------------------------------------|-----------------------------------------------|
| Improve data quality and consistency                      | More reliable and standardized information.   |
| Establish reliable and standardized datasets              | Consistent analytical foundations.            |
| Reduce manual data-processing and reporting work          | Less repetitive processing and recalculation. |
| Develop clear and relevant performance indicators         | Consistent performance measurement.           |
| Produce interactive dashboards and reports                | Accessible decision-ready information.        |
| Establish repeatable reporting processes                  | Consistent recurring reporting.               |
| Improve management access to timely information           | Faster access to relevant evidence.           |
| Identify trends, gaps, variations, and performance issues | Clearer performance diagnosis.                |
| Support evidence-based decision-making                    | Stronger management decisions.                |
| Provide documented and maintainable reporting solutions   | Sustainable handover and ownership.           |

## Professional Delivery Principles

Every assignment will be guided by a few practical principles that keep the work useful, responsible, and focused on the people who will use it.

| Principle            | Application                                                                             |
|----------------------|-----------------------------------------------------------------------------------------|
| Clarity first        | present findings in language that decision-makers and operational teams can understand  |
| Traceability         | keep a clear link between source data, transformations, calculations, and final results |
| Proportionality      | use methods and tools that match the client's needs, capacity, budget, and risk         |
| User involvement     | validate requirements and outputs with the people who will use the solution             |
| Responsible data use | protect confidentiality, minimize unnecessary data, and apply agreed access controls    |

|                            |                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Sustainability             | design processes that the client can refresh, explain, and maintain after handover                                             |
| Inclusive access           | design outputs for different levels of technical confidence and, where practical, consider accessibility and low-bandwidth use |
| Communication and adoption | explain changes early, record key decisions, and provide guidance that helps users adopt the new reporting process             |

### 3. Service Delivery Process

The service follows a clear, collaborative workflow. Each stage builds on the previous one, with client feedback and quality checks included throughout rather than left until the end.

**Figure 1. End-to-End Service Delivery Architecture**

| Phase | Primary question                             | Core output                |
|-------|----------------------------------------------|----------------------------|
| 1     | What decisions must the data support?        | Requirements specification |
| 2     | What data exist and where do they come from? | Source register            |
| 3     | Can the data be trusted?                     | Quality assessment         |
| 4     | How will data be standardized?               | Clean dataset              |
| 5     | How should data be structured?               | Analysis-ready model       |
| 6     | How will performance be measured?            | KPI dictionary             |
| 7     | What patterns and gaps exist?                | Analysis results           |
| 8     | How should information be presented?         | Dashboard                  |
| 9     | What recurring work can be simplified?       | Repeatable reporting       |
| 10    | Are results accurate?                        | Validated solution         |
| 11    | What does the evidence mean?                 | Management insights        |
| 12    | How should findings be communicated?         | Analytical report          |
| 13    | Can users maintain the system?               | Documentation              |
| 14    | Does it meet requirements?                   | Approved solution          |
| 15    | Can the client operate it?                   | Handover and support       |

### 4. Phase 1 — Requirements Assessment

Before any data work begins, the consultant and client will agree on the decisions the analysis should support, the people who will use the outputs, and the practical requirements for reporting.

| Requirement | Purpose |
|-------------|---------|
|-------------|---------|

|                                                          |                                           |
|----------------------------------------------------------|-------------------------------------------|
| Identify the purpose of the analysis                     | Define the scope before data work begins. |
| Identify the intended users of the output                | Define the scope before data work begins. |
| Identify key business/program questions                  | Define the scope before data work begins. |
| Identify reporting frequency                             | Define the scope before data work begins. |
| Identify required indicators and KPIs                    | Define the scope before data work begins. |
| Identify required reporting periods                      | Define the scope before data work begins. |
| Identify required breakdowns and dimensions              | Define the scope before data work begins. |
| Review existing reporting processes                      | Define the scope before data work begins. |
| Review existing dashboards and reports where applicable  | Define the scope before data work begins. |
| Identify required outputs and delivery formats           | Define the scope before data work begins. |
| Establish data-security and confidentiality requirements | Define the scope before data work begins. |

**Output**

Requirements and Reporting Specification — This document defines what information will be analyzed, how it will be presented, and what will be delivered.

## 5. Phase 2 — Data Collection & Data Inventory

The next step is to build a shared picture of the available data. Relevant sources will be gathered, documented, and checked for ownership, coverage, format, frequency, and relationships.

| Inventory element     | What is established                                    |
|-----------------------|--------------------------------------------------------|
| Data collection       | Collect available datasets                             |
| Data sources          | Identify data sources                                  |
| Data owners           | Identify data owners                                   |
| Reporting periods     | Identify reporting periods                             |
| Data formats          | Identify data formats                                  |
| Data frequency        | Identify data frequency                                |
| Dataset relationships | Identify relationships between datasets                |
| Data gaps             | Identify missing datasets or reporting periods         |
| Source of truth       | Establish the source-of-truth dataset where applicable |

**Output**

Data Inventory and Source Register

## 6. Phase 3 — Data Quality Assessment

Before analysis starts, the supplied data will be reviewed systematically to understand what is reliable, what needs attention, and what limitations should be communicated.

| Quality dimension | Assessment focus                       |
|-------------------|----------------------------------------|
| Completeness      | Review systematically before analysis. |
| Accuracy          | Review systematically before analysis. |
| Consistency       | Review systematically before analysis. |
| Validity          | Review systematically before analysis. |
| Uniqueness        | Review systematically before analysis. |
| Timeliness        | Review systematically before analysis. |
| Integrity         | Review systematically before analysis. |

| Assessment check                          | Purpose                                               |
|-------------------------------------------|-------------------------------------------------------|
| Identify missing values                   | Identify, correct, document or investigate the issue. |
| Identify duplicate records                | Identify, correct, document or investigate the issue. |
| Identify inconsistent values              | Identify, correct, document or investigate the issue. |
| Identify invalid values                   | Identify, correct, document or investigate the issue. |
| Check data types                          | Identify, correct, document or investigate the issue. |
| Check date fields                         | Identify, correct, document or investigate the issue. |
| Check categorical variables               | Identify, correct, document or investigate the issue. |
| Check numerical values                    | Identify, correct, document or investigate the issue. |
| Check identifiers                         | Identify, correct, document or investigate the issue. |
| Check reporting periods                   | Identify, correct, document or investigate the issue. |
| Identify outliers requiring investigation | Identify, correct, document or investigate the issue. |
| Identify structural problems              | Identify, correct, document or investigate the issue. |

### Output

Data Quality Assessment Report — The report will document identified issues and required corrective actions.

## 7. Phase 4 — Data Cleaning

Based on the agreed rules, the data will be cleaned and standardized in a controlled way. Changes will be documented so that the process remains transparent and repeatable.

| Cleaning area                       | Standard treatment                            |
|-------------------------------------|-----------------------------------------------|
| Remove or resolve duplicate records | Apply agreed rules and preserve traceability. |
| Standardize field names             | Apply agreed rules and preserve traceability. |
| Standardized categories             | Apply agreed rules and preserve traceability. |
| Correct formatting inconsistencies  | Apply agreed rules and preserve traceability. |
| Standardized dates                  | Apply agreed rules and preserve traceability. |
| Standardize numerical fields        | Apply agreed rules and preserve traceability. |

|                                                     |                                               |
|-----------------------------------------------------|-----------------------------------------------|
| Address is missing values according to agreed rules | Apply agreed rules and preserve traceability. |
| Remove irrelevant fields where appropriate          | Apply agreed rules and preserve traceability. |
| Correct identifiable data-entry inconsistencies     | Apply agreed rules and preserve traceability. |
| Maintain data integrity and traceability            | Apply agreed rules and preserve traceability. |

**Output**

Cleaned and Standardized Dataset — The original source data will remain preserved separately from the cleaned dataset.

## 8. Phase 5 — Data Transformation

Once cleaned, the data will be reshaped into a practical structure for analysis and reporting, with clear fields, consistent dimensions, and appropriate relationships between datasets.

**Figure 2. Data Preparation and Analysis Flow**

| Raw Sources | Cleaned Data | Transformed Data | Data Model | KPI Layer | Analysis Layer |
|-------------|--------------|------------------|------------|-----------|----------------|
|-------------|--------------|------------------|------------|-----------|----------------|

→ → → → →

| Transformation task                                  | Purpose                                                  |
|------------------------------------------------------|----------------------------------------------------------|
| Combine datasets where required                      | Prepare the dataset for reliable analysis and reporting. |
| Append datasets where required                       | Prepare the dataset for reliable analysis and reporting. |
| Merge related datasets                               | Prepare the dataset for reliable analysis and reporting. |
| Create required fields                               | Prepare the dataset for reliable analysis and reporting. |
| Create calculated fields                             | Prepare the dataset for reliable analysis and reporting. |
| Structure dates and reporting periods                | Prepare the dataset for reliable analysis and reporting. |
| Standardize dimensions                               | Prepare the dataset for reliable analysis and reporting. |
| Prepare analytical tables                            | Prepare the dataset for reliable analysis and reporting. |
| Establish appropriate relationships between datasets | Prepare the dataset for reliable analysis and reporting. |

**Output**

Analysis-Ready Dataset / Data Model

## 9. Phase 6 — KPI & Indicator Development

Together with the client, the required KPIs and indicators will be defined in plain language and documented well enough for different users to calculate and interpret them consistently.

| KPI / indicator field | Purpose                                           |
|-----------------------|---------------------------------------------------|
| Indicator name        | Ensure consistent calculation and interpretation. |
| Definition            | Ensure consistent calculation and interpretation. |

|                               |                                                   |
|-------------------------------|---------------------------------------------------|
| Purpose                       | Ensure consistent calculation and interpretation. |
| Data source                   | Ensure consistent calculation and interpretation. |
| Calculation method            | Ensure consistent calculation and interpretation. |
| Numerator                     | Ensure consistent calculation and interpretation. |
| Denominator                   | Ensure consistent calculation and interpretation. |
| Unit of measurement           | Ensure consistent calculation and interpretation. |
| Target                        | Ensure consistent calculation and interpretation. |
| Actual value                  | Ensure consistent calculation and interpretation. |
| Reporting frequency           | Ensure consistent calculation and interpretation. |
| Reporting period              | Ensure consistent calculation and interpretation. |
| Responsible data source/owner | Ensure consistent calculation and interpretation. |
| Disaggregation requirements   | Ensure consistent calculation and interpretation. |

**Output**

KPI / Indicator Dictionary

## 10. Phase 7 — Data Analysis

The prepared dataset will be analyzed against the agreed questions and indicators. The focus will be on explaining patterns, differences, progress, and exceptions: not simply producing numbers.

| Analysis type                 | Management question                        |
|-------------------------------|--------------------------------------------|
| Descriptive analysis          | What happened?                             |
| Trend analysis                | How has performance changed?               |
| Comparative analysis          | How do groups or periods differ?           |
| Performance analysis          | Which areas are performing well or poorly? |
| Variance analysis             | Where does actual differ from expected?    |
| Target versus actual analysis | Are targets being achieved?                |
| Period-to-period analysis     | What changed between periods?              |
| Category analysis             | Which categories contribute most?          |
| Geographic analysis           | Where are patterns concentrated?           |
| Departmental analysis         | Which organizational areas differ?         |
| Outlier analysis              | Which observations require investigation?  |
| Data-quality analysis         | Could limitations affect the conclusion?   |

**Output**

Data Analysis Results

## 11. Phase 8 — Dashboard Development

An interactive dashboard will be developed around the approved questions and KPI framework. Its design will prioritize clear navigation, readable visuals, and the information users need most often.

**Figure 3. Dashboard Information Architecture**

| Executive KPIs | Performance Overview | Trend & Comparison | Filters / Slicers | Detailed Analysis | Decision / Action |
|----------------|----------------------|--------------------|-------------------|-------------------|-------------------|
|----------------|----------------------|--------------------|-------------------|-------------------|-------------------|

→ → → → →

| Component                                                                                          | Purpose                                                     |
|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| KPI cards                                                                                          | Provide clear, navigable and decision-oriented information. |
| Performance indicators                                                                             | Provide clear, navigable and decision-oriented information. |
| Trend charts                                                                                       | Provide clear, navigable and decision-oriented information. |
| Comparison charts                                                                                  | Provide clear, navigable and decision-oriented information. |
| Tables                                                                                             | Provide clear, navigable and decision-oriented information. |
| Summary views                                                                                      | Provide clear, navigable and decision-oriented information. |
| Detailed views                                                                                     | Provide clear, navigable and decision-oriented information. |
| Filters                                                                                            | Provide clear, navigable and decision-oriented information. |
| Slicers                                                                                            | Provide clear, navigable and decision-oriented information. |
| Date controls                                                                                      | Provide clear, navigable and decision-oriented information. |
| Drill-down functionality                                                                           | Provide clear, navigable and decision-oriented information. |
| Conditional formatting                                                                             | Provide clear, navigable and decision-oriented information. |
| Performance status indicators                                                                      | Provide clear, navigable and decision-oriented information. |
| The dashboard will be designed for usability, clarity, consistency, and management decision-making | Provide clear, navigable and decision-oriented information. |

### Output

Interactive Dashboard

## 12. Phase 9 — Reporting Automation

Where the data environment allows, recurring reporting steps will be simplified or automated. The aim is to reduce avoidable manual effort while keeping the process easy to review and control.

| Automation area                                    | Expected result                                                  |
|----------------------------------------------------|------------------------------------------------------------------|
| Establish standardized data-input structures       | Reduce avoidable manual work while retaining review and control. |
| Establish repeatable data-transformation processes | Reduce avoidable manual work while retaining review and control. |
| Automate recurring calculations                    | Reduce avoidable manual work while retaining review and control. |

|                                                       |                                                                  |
|-------------------------------------------------------|------------------------------------------------------------------|
| Automate dashboard updates where technically feasible | Reduce avoidable manual work while retaining review and control. |
| Establish refresh procedures                          | Reduce avoidable manual work while retaining review and control. |
| Standardize recurring reporting outputs               | Reduce avoidable manual work while retaining review and control. |
| Reduce manual copying and recalculation               | Reduce avoidable manual work while retaining review and control. |

**Figure 4. Automated Reporting Cycle**

## 13. Phase 10 — Data Validation & Quality Assurance

Before delivery, the data, calculations, dashboards, and refresh process will be tested against agreed checks. Any exceptions will be resolved or clearly documented.

| QA layer               | Validation checks                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------|
| Data validation        | Source data reconciliation, Record counts, Totals, Missing values, Duplicate records, Data consistency |
| Calculation validation | KPI formulas, Aggregations, Percentages, Ratios, Growth calculations, Target calculations              |
| Dashboard validation   | Filters, Slicers, Dates, Charts, KPI values, Tables, Navigation, Drill-down functionality              |
| Refresh validation     | Data refresh, Transformation steps, Calculations, Dashboard updates                                    |

**Figure 5. Quality Assurance Gate**

## 14. Phase 11 — Management Insights

Validated results will be translated into a concise management narrative that explains what has changed, why it matters, and where attention may be needed.

| Insight area                          | Management interpretation                                          |
|---------------------------------------|--------------------------------------------------------------------|
| Significant trends                    | Explain what changed, why it matters and whether action is needed. |
| Performance changes                   | Explain what changed, why it matters and whether action is needed. |
| Variations                            | Explain what changed, why it matters and whether action is needed. |
| Gaps                                  | Explain what changed, why it matters and whether action is needed. |
| Exceptions                            | Explain what changed, why it matters and whether action is needed. |
| Underperforming areas                 | Explain what changed, why it matters and whether action is needed. |
| High-performing areas                 | Explain what changed, why it matters and whether action is needed. |
| Data-quality concerns                 | Explain what changed, why it matters and whether action is needed. |
| Areas requiring further investigation | Explain what changed, why it matters and whether action is needed. |

Figure 6. From Analysis to Management Decision

## 15. Phase 12 — Report Development

When a formal report is required, it will bring the validated evidence, interpretation, and supporting visuals into one coherent document suited to the intended audience.

| Report section            | Purpose                                                   |
|---------------------------|-----------------------------------------------------------|
| Executive summary         | Present validated evidence and interpretation coherently. |
| Methodology               | Present validated evidence and interpretation coherently. |
| Data overview             | Present validated evidence and interpretation coherently. |
| KPI results               | Present validated evidence and interpretation coherently. |
| Performance analysis      | Present validated evidence and interpretation coherently. |
| Trend analysis            | Present validated evidence and interpretation coherently. |
| Key findings              | Present validated evidence and interpretation coherently. |
| Data-quality findings     | Present validated evidence and interpretation coherently. |
| Management considerations | Present validated evidence and interpretation coherently. |

|                          |                                                           |
|--------------------------|-----------------------------------------------------------|
| Supporting tables/charts | Present validated evidence and interpretation coherently. |
|--------------------------|-----------------------------------------------------------|

**Output**

Final Analytical / Performance Report

## 16. Phase 13 — Documentation

The solution will be documented so that future users can understand how the data flows, how indicators are calculated, and how reports can be refreshed and maintained.

| Documentation item        | Purpose                                                        |
|---------------------------|----------------------------------------------------------------|
| Data dictionary           | Enable users to understand, refresh and maintain the solution. |
| KPI dictionary            | Enable users to understand, refresh and maintain the solution. |
| Data-cleaning rules       | Enable users to understand, refresh and maintain the solution. |
| Transformation procedures | Enable users to understand, refresh and maintain the solution. |
| Calculation methodology   | Enable users to understand, refresh and maintain the solution. |
| Dashboard guide           | Enable users to understand, refresh and maintain the solution. |
| Data-refresh procedure    | Enable users to understand, refresh and maintain the solution. |
| Reporting procedure       | Enable users to understand, refresh and maintain the solution. |
| Technical documentation   | Enable users to understand, refresh and maintain the solution. |

**Output**

Reporting System Documentation

## 17. Phase 14 — Client Review

The completed solution will be shared with the client for a practical review. Feedback will be checked against the agreed scope, documented, and addressed before approval.

| Review area             | Acceptance question                                      |
|-------------------------|----------------------------------------------------------|
| Data accuracy           | Does the completed solution meet the agreed requirement? |
| KPI definitions         | Does the completed solution meet the agreed requirement? |
| Dashboard functionality | Does the completed solution meet the agreed requirement? |
| Report content          | Does the completed solution meet the agreed requirement? |

|                                                             |                                                          |
|-------------------------------------------------------------|----------------------------------------------------------|
| Required modifications                                      | Does the completed solution meet the agreed requirement? |
| Usability                                                   | Does the completed solution meet the agreed requirement? |
| Reporting requirements                                      | Does the completed solution meet the agreed requirement? |
| Agreed revisions will be incorporated before final handover | Does the completed solution meet the agreed requirement? |

**Output**

Client-Approved Reporting Solution

## 18. Phase 15 — Final Handover

After approval, the final solution will be handed over in the agreed format, together with the files and guidance needed for confident day-to-day use.

| Handover component       | Purpose                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------|
| Clean dataset            | Provide the client with the operational or reference component required after approval. |
| Data model               | Provide the client with the operational or reference component required after approval. |
| Excel dashboard          | Provide the client with the operational or reference component required after approval. |
| Power BI dashboard       | Provide the client with the operational or reference component required after approval. |
| KPI/indicator dictionary | Provide the client with the operational or reference component required after approval. |
| Data-quality report      | Provide the client with the operational or reference component required after approval. |
| Analytical report        | Provide the client with the operational or reference component required after approval. |
| Management insights      | Provide the client with the operational or reference component required after approval. |
| User guide               | Provide the client with the operational or reference component required after approval. |
| Refresh instructions     | Provide the client with the operational or reference component required after approval. |
| Technical documentation  | Provide the client with the operational or reference component required after approval. |

**Output**

Final handover package including the agreed files and guidance.

## 19. Post-Delivery Support

After handover, limited support may be provided to help the client resolve early issues, apply agreed minor updates, and build confidence in maintaining the solution.

| Support area                                                                                 | Typical support                                        |
|----------------------------------------------------------------------------------------------|--------------------------------------------------------|
| Data-refresh support                                                                         | Provided within the agreed support scope and duration. |
| Minor corrections                                                                            | Provided within the agreed support scope and duration. |
| Reporting updates                                                                            | Provided within the agreed support scope and duration. |
| KPI modifications                                                                            | Provided within the agreed support scope and duration. |
| Data-source changes                                                                          | Provided within the agreed support scope and duration. |
| User guidance                                                                                | Provided within the agreed support scope and duration. |
| Technical support                                                                            | Provided within the agreed support scope and duration. |
| The duration and scope of support will be agreed with the client before project commencement | Provided within the agreed support scope and duration. |

The duration and scope of support will be agreed with the client before project commencement.

## 20. Client Responsibilities

Successful delivery depends on timely collaboration. The client will be responsible for:

| Responsibility                                           | Expected contribution                                   |
|----------------------------------------------------------|---------------------------------------------------------|
| Providing accurate source information                    | Complete or confirm within the agreed project timeline. |
| Identifying authorized data sources                      | Complete or confirm within the agreed project timeline. |
| Confirming KPI definitions                               | Complete or confirm within the agreed project timeline. |
| Providing required reporting requirements                | Complete or confirm within the agreed project timeline. |
| Reviewing outputs within the agreed timeframe            | Complete or confirm within the agreed project timeline. |
| Confirming corrections or changes                        | Complete or confirm within the agreed project timeline. |
| Providing appropriate access where required              | Complete or confirm within the agreed project timeline. |
| Ensuring that the data supplied can legally be processed | Complete or confirm within the agreed project timeline. |

## 21. Data Confidentiality

Client data will be handled with care, treated as confidential, and used only for the agreed analytical and reporting purpose.

Access will be limited to the information and people genuinely required to deliver the service.

Before work begins, the client and service provider will agree how data will be stored, transferred, retained, and securely disposed of, taking account of its sensitivity and applicable requirements.

| Control area       | Minimum practice                                        |
|--------------------|---------------------------------------------------------|
| Purpose limitation | Use data only for agreed analytical/reporting purposes. |

|                |                                                     |
|----------------|-----------------------------------------------------|
| Access control | Restrict access to people who genuinely require it. |
| Storage        | Use agreed secure storage.                          |
| Transfer       | Use approved secure transfer methods.               |
| Retention      | Agree retention periods.                            |
| Disposal       | Securely dispose of data when authorized.           |

## 22. Standard Deliverables

The final deliverables will be determined according to the project scope.

| Deliverable             | Description                               |
|-------------------------|-------------------------------------------|
| Data Assessment         | Review of data and reporting requirements |
| Data Quality Report     | Identified data-quality issues            |
| Clean Dataset           | Standardized analysis-ready data          |
| Data Model              | Structured analytical data                |
| KPI Dictionary          | Definitions and calculation methodology   |
| Dashboard               | Interactive Excel/Power BI dashboard      |
| Analysis                | Statistical and performance analysis      |
| Automated Reporting     | Repeatable reporting workflow             |
| Management Insights     | Key findings from the data                |
| Analytical Report       | Formal reporting output                   |
| User Guide              | Instructions for using the solution       |
| Refresh Guide           | Instructions for updating the data        |
| Technical Documentation | Documentation of the reporting system     |

## 23. Technology

The service may utilize:

| Technology                 | Typical role                                                     |
|----------------------------|------------------------------------------------------------------|
| Microsoft Excel            | Data preparation, analysis, reporting and dashboards.            |
| Power Query                | Data extraction, transformation and repeatable preparation.      |
| Power Pivot                | Data modelling and analytical relationships.                     |
| Power BI                   | Interactive dashboards, modelling, DAX and management reporting. |
| DAX                        | Measures, calculations and analytical logic.                     |
| SQL                        | Querying and preparing structured database data.                 |
| Statistical analysis tools | Advanced analysis where required.                                |
| Data visualization tools   | Visual presentation of trends, comparisons and performance.      |

|                                                             |                                                                     |
|-------------------------------------------------------------|---------------------------------------------------------------------|
| Appropriate automation and AI technologies where beneficial | Selective automation or augmentation where it adds practical value. |
|-------------------------------------------------------------|---------------------------------------------------------------------|

Technology choices will be made with the client's data environment, user capacity, budget, security needs, and reporting objectives in mind. The simplest dependable option will be preferred over unnecessary complexity.

## 24. Success Criteria

The solution will be considered successful when users can trust the results, understand how they were produced, and maintain the reporting process with reasonable effort. In practical terms, it should provide:

Reliable and structured data

| Success dimension                 | Evidence                                                            |
|-----------------------------------|---------------------------------------------------------------------|
| Clearly defined KPIs              | Demonstrated through the delivered solution and documented process. |
| Accurate calculations             | Demonstrated through the delivered solution and documented process. |
| Interactive reporting             | Demonstrated through the delivered solution and documented process. |
| Reduced repetitive manual work    | Demonstrated through the delivered solution and documented process. |
| Repeatable reporting processes    | Demonstrated through the delivered solution and documented process. |
| Clear management information      | Demonstrated through the delivered solution and documented process. |
| Documented methodology            | Demonstrated through the delivered solution and documented process. |
| Maintainable reporting processes  | Demonstrated through the delivered solution and documented process. |
| Appropriate data-quality controls | Demonstrated through the delivered solution and documented process. |

## 25. Final Service Output

The overall service transforms:

**Figure 7. Final Service Output Chain**

The goal is not simply to deliver a spreadsheet or visualization. It is to leave the client with a complete, accurate, practical, repeatable, and maintainable data analytics and reporting solution: one that people trust, understand, and can use to make better decisions.

**Final value**

The service leaves the client with a complete, accurate, practical, repeatable and maintainable analytics and reporting solution.

## Appendix A — Client Intake Checklist

| Requirement question                               | Client response / notes |
|----------------------------------------------------|-------------------------|
| What decision should the analysis support?         |                         |
| Who will use the output?                           |                         |
| What data sources are available?                   |                         |
| What reporting periods are required?               |                         |
| What KPIs are already defined?                     |                         |
| What KPIs need to be developed?                    |                         |
| What breakdowns are required?                      |                         |
| What dashboard/report format is preferred?         |                         |
| How often must data be refreshed?                  |                         |
| What confidentiality or access restrictions apply? |                         |
| What deadline applies?                             |                         |
| Who approves the final output?                     |                         |

## Appendix B — Delivery Governance at a Glance

### Governance sequence

|                      |       |          |               |         |          |         |
|----------------------|-------|----------|---------------|---------|----------|---------|
| Scope & Requirements | Build | Validate | Client Review | Approve | Handover | Support |
|----------------------|-------|----------|---------------|---------|----------|---------|

→ → → → → →

| Decision gate   | Minimum evidence                                                 |
|-----------------|------------------------------------------------------------------|
| Scope gate      | Requirements and reporting specification approved.               |
| Data gate       | Sources inventoried and quality limitations understood.          |
| Build gate      | Data model, KPI framework and analytical outputs prepared.       |
| QA gate         | Validation completed and exceptions documented.                  |
| Acceptance gate | Client review completed and revisions agreed.                    |
| Handover gate   | Final files, documentation and refresh instructions transferred. |
